

FoxByte

A database that behaves exactly like the widely-used PostgreSQL — with three superpowers on top: **instant copies**, a **rewind button** for your data, and **continuous cloud backup** — while everyday speed is never sacrificed.

How it fits together — read top to bottom: people and programs connect, the live database serves them fast, and its history is safely copied to the cloud.

Four capabilities, in plain language

Standard, and asleep when idle

Your existing apps connect with zero changes.
Computing power wakes up on demand and sleeps when idle.

Like a motion-sensor light — on when needed, off (and cheap) when not.

Instant Branching

Copy the entire database in seconds, using almost no extra space — a private, disposable sandbox for each AI agent, test, or feature.

Like “Duplicate” on a document — but for a whole database, instantly.

Time Travel

Rewind the database to any moment in the past to undo a mistake or inspect exactly how things looked.

Like Undo and version history — for all of your data at once.

Never Lose Data

Every change is continuously copied to durable cloud storage in the background, without slowing anything down.

Like auto-save to the cloud — always on, never in the way.

How your data flows

1. **Connect:** your app talks to FoxByte exactly like a normal PostgreSQL database.
2. **Serve fast:** everyday reads and writes happen at full speed on fast local storage.
3. **Protect in the background:** every change streams to cloud storage — powering time-travel and instant recovery.
4. **Branch on demand:** a full copy of the database is created in seconds whenever an agent or developer needs one.

Why it matters

1. **Move faster & safer:** give every experiment its own copy, and undo mistakes with time-travel.
2. **Built for AI:** each AI agent gets its own isolated database to work in — then it’s thrown away, cleanly.
3. **Lower cost & risk:** copies and backups are cheap; the database you already trust (PostgreSQL) stays at the core.

Built on proven, open foundations: PostgreSQL (the database), ZFS (instant copies), and cloud object storage (durable history). ·

Licensed open source. · **Working today:** continuous backup, time-travel, and instant branching. · Next: one-branch-per-AI-agent API.
